

This is a port of the MAME 0.37b5 emulator created by Nikola Salmoria for GP2X, WIZ and CAANOO... There are over 2270 different supported romsets. To support romsets that are not compatible with the emulator, there are emulators that allow you to play games from ROM files on any platform. For games that do not support the emulator, there is a special program called REAPER. You can load a game from a ROM file into it and use an image as a sprite that will be shown in the emulator. The program allows you to load several images into the emulator at once, and then select them.
