**POWER-KI Developer Edition Full Version**

**POWER-KI is a logic**

---

programming language with Eiffel-style features, designed for building microcontrollers and robotics devices and embedded control systems. Its architecture is based on the "Concept" paradigm: the goal is to provide a simple, easy-to-understand language, without code bloat, where concepts are the "program code", and the language defines a set of rules to create specific concepts. The basic concept in POWER-KI is

---

called "Concept": A "Concept" is a functional unit able to react in a defined way, in terms of data processing or data storage, to an incoming information.

Example: An "IF" concept: if an information arrives, change the output, else do nothing.

the software for the use of the PWG-PRG or POWER-KI kit. This software allows developers to easily generate license keys and manage licenses. License key generating: Generate new license keys or edit existing ones. License list management: Loads or updates the licenses saved by the customer. Generate the keys for your software: Generates the keys for your use. In order to use the software, you must generate a key through the

License Key generating section  
and then load or update the keys  
using the License List

Management section. New  
license key generating: Create  
new license keys that will be  
used as valid keys for your use.  
When you edit an existing key,  
the old one will be overwritten.

Licenses list management:

Manage licenses, which are  
saved and stored for use by the  
key. Editing and loading keys:  
Edits an existing key or loads a

new key. Using License Key Generating: The first step of using this software is to generate a key. To do so, you must choose a Product Name, enter the serial number and the license ID, and click the Generate button to start. License list management: Allows you to manage license keys and license lists. Licenses list: Loads or updates the license keys saved on the list. The next step is to choose a license list and, in this

case, the name of the license list will be "Test". License list:

Manage the license lists available on your computer.

License list creation: Create a new license list. The next step is to create a key and save it in the license list. Once the license list is saved, it will be loaded from the License List management section. License list creation:

"You can call it a programming language because it is, but you can also call it a development environment, a UI builder, or even an operating system for I.A (Intelligent Applications). Using power kiwi, you can create prototypes of your apps, debug them as soon as they are completed, package apps for deployment, and generate native cloud UIs and websites."

"POWER-KI is an open source I.A development environment, language, compiler and a stack for creating control systems, supervisory tools, and Internet of Things utilities. POWER-KI was initially created for the control of motorized vehicles, but the author saw it was capable of creating a general architecture for I.A. Because of that, the acronym has become quite popular since. The toolset is created in the spirit of: "If you

---

can't do it with software, do it with software". Hence, the language and the toolset are both based on the work of Mike Verhulst, a Dutch programmer and computer scientist. But, as is the case in all I.A, POWER-KI has been used for other things as well, like big data analysis, machine learning, etc."

"Power-KI is a programming language designed for the creation of I.A, with a language to adapt to the programming

---

tasks that need to be created. This type of project is called a "Development Environment", because it's a setup where one can create applications without the need to first learn the programming language used. However, for those who are familiar with coding languages, the POWER-KI development environment is considered to be like "an interface to add extra functions" to the programming language. As the language has

---

been developed for the purpose of being as close to a classical language as possible, the developer will find numerous familiar terms and techniques. Because of this, it is said that it is possible to create applications that are almost as fast as they would be in traditional languages. On the other hand, it is also possible to take advantage of all the current available libraries and tools in the environment. Using the

---

"WorkBench" interface, it is possible to edit, test, and debug one's projects using a modern editor and integrated debugger. The development environment

New package for (PWG-PRG) that takes as input a PRG that will be used as the basic block to be reprogrammed. The new package simply gives the ability to convert a PRG to a PWK

Program. This package is usually used when you have existing PRGs (in other languages) that you want to convert them into a PWK program. It can also be used to develop new programs using this language. The new package is the same as the previous one except that the "convertPRGToPWK" function now takes the input as a string parameter instead of a file parameter. This package is for:
