In this tutorial, we will show you how to burn MPEG files to a DVD or CD disc. License: Freeware File size: 1.08 MB
Date added: November 16, 2009 Price: Free Download counter: 21 Website: Accessing child form controls from parent form Why is it that if I access this from a ControlDesigner, control.Properties["...."] = "test"; Then the assigned value doesn't persist. (I'm not allowed to use a text editor) If I run the control designer, control.Properties["...."] = "test"; this.Controls["...."].Text = "test"; I don't get the same effect. Is there some other way to access the value that doesn't use the ControlDesigner? A: Is there some other way to access the value that doesn't use the ControlDesigner? All controls have their properties set and can be modified from within the control designer using the Properties window. You just need to be sure that you are actually setting the correct values on the correct controls. You don't use the control designer to modify the text of your label. For example, if you have a label on your form and are looking at it in the designer window, set its Text property to "my text". This will be reflected in the code. If you then change your mind and wish to modify the value stored on your text box instead, then do so on your control designer, and set its Text property to "new text". Q: ArrayList versus LinkedList and std::list I noticed that there are two common data structures that one can use in C++: std::list (i.e., std::list) std::vector (i.e., std::vector) Both of these structures are often used in conjunction with std::map (i.e., std::map) to track and access information about elements stored in the data structure. In Java, this would be equivalent to using java.util.ArrayList or java.util.LinkedList. I am curious if anyone else has used these two structures extensively and can explain the distinctions between them. The reason I ask is
