I want to know what does it mean when the repo is used as a dependency of some other class. As per msdn here a domain object and repository have a dependency relation. I am using mvc. I am having a question. When I am using a repository in some class it's means it will be used in some controller action? I have read that a Repository should be unit testable. What does it means. Does it mean a controller action should be unit testable? I am new to this. Any help would be appreciated. A: When a class that uses a repository references a repository, it usually doesn't know that that particular repository contains domain objects (perhaps the data type is not an entity). When you are testing, you can use a mock repository to verify that your code behaves as expected. If you use a repository that actually has an implementation of the repository interface, it won't be possible to mock it. Therefore, to mock out the repository you need to make sure that the code has no reference to the repository. In other words, you need to mock it. Many data storage and computing systems may comprise multiple memory devices, such as flash memory devices, into which data may be written and from which data may be read. As an example, solid-state disk (SSD) controllers may comprise one or more single-level cell (SLC) flash memory devices for storage of user data and/or host data cache. SSD controllers may utilize embedded flash memory to provide storage of data cached for later retrieval by the host, with the stored data typically being a subset of the data that is requested
