Macros are a very useful tool to automate various repetitive tasks, be it in creating drawings or in editing them. Macros can save you a great deal of time and let you complete your work in a shorter time. However, often you might face problems while creating or editing macros because of some system's restrictions. In that case, you might end up asking for professional help. Creating macros for Windows and macOS is easy with the help of a text editor and a set of Windows API calls. In this tutorial, we will guide you through this process of how to create macros in Windows 7, 8, 8.1, 10, and macOS 10.11 using TextPad,

WordPad, or Sublime Text. Step 1. Setting up the editor Let's start by setting up your text editor. The most commonly used one is TextPad or WordPad. Microsoft Word has a native feature to work with macros, but it is usually not as effective as the Windows API (application programming interface). Also, it cannot be used in macOS. For Mac users, there is a good alternative for Microsoft Word that works with the Windows API, called Sublime Text. TextPad is not a text editor and can only be used to create macros. So we will be using WordPad or Sublime Text. There are three ways to use the Windows API: using C++, Jscript, and VBScript. In this tutorial, we will be working with VBScript, as it is easier and faster to use. For creating macros in Windows 7, 8, 8.1, 10, and macOS 10.11, use WordPad or Sublime Text. Step 2. Create a Macro We will be using a simple example to explain this process. For instance, if you are copying the same line and copying the same paragraph over and over again, you can save a lot of time by creating a macro. So create a macro and name it as you wish. In the next step, you will need to find where the Macro file is created. In some instances, it might be saved under Options (see figure). Step 3. Create a Subroutine There are two ways to create a subroutine in the Macro. The first method is to create a Subroutine and store the line number in a Variable. This is shown in the following figure. The second method is to create a Subroutine and store the line number and paragraph number in Variables 77a5ca646e
