F-Curves A common use of the F-Curves tool is to create animations. By analyzing the values of variables over time, the user can animate a changing parameter of a model such as the diameter of a hole over time. The user can control a position of an object over time, and can curve this control into an animation. The F-Curve tool is best explained with an example. A user has three objects, each with a "force" parameter. The user wishes to create an animation of the force applied to the objects as they move over time. This is

---

best illustrated by showing two graphs. The first graph shows the initial state of the parameters. The second graph shows the changing values of the parameters over time. In this example the force applied to the objects increases from point A to point B. Dimensioning is the process of establishing a tolerance level. If the dimensional tolerance is exceeded, then the object is not drawn. AutoCAD uses a 2-point tolerance based on the nearest existing point, or the last selected dimension of an object if no existing dimensions are selected. In case of a repeat command (dragging), the new dimension is based on the nearest existing point. Objects can be dimensioned with respect to the user defined base and origin (if set). Dimensions can be fixed, or relative. The setting of a dimension affects the dimension and all of the items to which it is linked. The properties of the dimension can be changed to change the affect of the dimension and all of its linked items. Drawings A drawing is a template of the design. Each drawing has a corresponding template called the template layer, in which dimensions are located, and the objects are placed in accordance with the drawing's design. AutoCAD, along with some other products, offers several methods of creating drawings, with the most common being the use of templates. There are three types of templates: Draft templates Standard templates Customizable templates Draft templates can be used as a starting point for creating a drawing. Standard templates can be used as a starting point for creating a new drawing. Customizable templates are designed by users to work exactly as they wish. A drawing is composed of a number of drawing objects which are placed in the template. The objects are grouped into layers, and each layer is dimensioned. Dimensional constraints

A new company called Polychain Capital, which is based in Switzerland, announced last week that it was raising some \$16.5 million in venture capital to fund the development of "a cryptocurrency-backed platform" for institutional investors. The firm plans to raise more funds in the future. A company based in Switzerland called Polychain is planning to issue "a cryptocurrency-backed platform" in which companies that provide "fiduciary financial services" (essentially, financial service companies that provide investment advice or brokerage services to individuals or other entities) will be able to offer services based on a new kind of "cryptocurrency" called the "Polychain Crypto-asset Protocol Token." As Polychain points out, the foundation of all these new financial services will rely on a new kind of digital asset, the Polychain Token (POLY), which will be used to provide access to the platforms it plans to launch. To make this project work, Polychain plans to use a new kind of ledger, called the "Polychain Network," which will manage the private keys for the POLY tokens, and will make it possible to transfer the POLY tokens on a secure, decentralized basis. The startup claims that the use of a blockchain to manage private keys will make the POLY tokens "secure" and "stable," and is thus an ideal foundation for what the company is hoping will be a whole range of new financial services. More important, Polychain notes, the POLY tokens can be used to "enrich" existing financial services, providing the "backbone" of security that will make Polychain's business plan possible. As such, the company believes that it will be
