What's New in the?

General options What's better than having a browser that automatically saves your scroll position everytime you leave a page? Probably nothing more than having it actually remembering and then redrawing that scroll position every time you go back to that page. Without further ado, allow us to present to you Scroll In - a very user-friendly Chrome extension with a lot of tools that you can use to maintain the exact same scrolling position of a page when going back to it. Scroll In works on the way that any other website inspector would. You can check out the entire website, edit the page properties, and even check out the source code. However, there are some things that Scroll In does a little bit differently. First, the tool is not limited to webpages that are open in the browser itself. In fact, you can save the scroll position of any webpage, regardless of whether or not the page is loaded in the browser. If you manage to lose the position, no worries, you can refresh the page, scroll to the saved position, and everything will be back to normal. Another great thing about Scroll In is

that, along with saving the current scroll position, you can also drag and drop it to a new position. In other words, it allows you to recreate the exact same position as last time whenever it sees fit. The tool allows you to make the page disappear from view, check out its source, open up the editing tools, and much more. You can even hide all the elements on the page (even the ones that are hidden by CSS) to give you a better idea of what you're looking at. Scroll In Basics: What's great about Scroll In is that it takes something that many websites have been offering for years, and it makes it a lot easier to use. This is the kind of extension that will not only make you a lot more efficient while you're browsing the web, but it also allows you to save the most important things for later use. That said, once you've installed the extension, make sure to keep a watchful eye on it to make sure that Scroll In doesn't start making any false alarms in the form of website warnings when you're browsing. One thing that I think you should especially be aware of when browsing is that a lot of websites will have annoying "flash player" warnings that
