Note A _rpease_ is a critical tool for retouching and other image editing tasks. The default tool in Photoshop is the Rectangular Marquee tool (Selection→ Select→ Rectangular Marquee). You can create numerous layers and use the Add Layer Mask command to make changes to layers without altering the layer beneath it. (For details on layers and the mask, see Layers and the Masking Tab.) If you create a layer to make a certain part of your image black and white, for example, you can change that part to color while leaving the rest in black and white. See Work with Layers to learn more.

What is Photoshop? Computer-aided design (CAD) has become a popular job for people who have made graphic design their career. In CAD, a design is made up of shapes and other elements. These objects are grouped together to form the final image. People use special software like Photoshop to create and edit these objects. The most commonly used image editing software is Photoshop, although you can use other, more specialized software for specific purposes. However, Photoshop is not just a graphics program. The software has many different ways to edit images, including some of the more complex functionality mentioned below. Adobe Photoshop is a classic example of the design for software evolution, while Adobe Creative Suite is a product that includes the desktop version of Photoshop. Photoshop is great but its price is too high for many people. You can learn Photoshop Elements to edit images in a different way and still get the same results. Anyone can use Photoshop Elements to edit images if you download the software and have the time to learn its functions and use it. You will find the software is simple to use, unlike its more professional version. The use of graphic design applications is not limited to professionals, but Photoshop is the most popular choice for graphic designers, photo editors and other professionals. The software has many benefits and can be used for many different purposes, including to create high-quality images for graphic design, web design, illustrations and many other projects. Can Photoshop Elements work the same as Photoshop? Yes, Photoshop Elements has many of the features of the professional version. It also includes a lot of these features at a more affordable price, making it possible to use it for any purpose. You can use Elements to edit photos, add details and colors, change the size and style of elements, fill in spaces and colors, perform advanced editing techniques, and more. The only limitations to the software are the maximum file size you can use, the amount of RAM (memory) you can use and the number of layers you can use. If you want the features and functionality of a more advanced photo editing program, you should use Photoshop. Photoshop is advanced, but it is more expensive, so you can use Photoshop Elements for many of the same tasks, especially when you purchase a program that includes Photoshop. What are the benefits of Photoshop Elements? Elements has many benefits and features that help you do more than edit photos. 05a79cecff

Central Line-Associated Bloodstream Infection and Its Incidence in the UK: A National Audit. Central line-associated bloodstream infection (CLABSI) contributes to high morbidity and mortality, and is often healthcare associated. National benchmarking aims to improve infection control practice. We audited all 2,035 consecutive adult hospital admissions in a single NHS acute trust and used descriptive statistics to provide an insight into differences in CLABSI incidence for independent variables: outcome, site of infection, onset, and pathogen type. Incidence rates in adults were calculated as the number of CLABSI per 1,000 central line days. There were 1,296 admissions. Overall CLABSI incidence was 3.01/1,000 central line days, increasing to 4.01/1,000 central line days in patients over 65 years. The median number of days on central lines was 6. Vascular catheter-associated bloodstream infections (CABSIs) and pneumonia-CLABSI were the most common outcomes (61% and 39%, respectively). A significant reduction in incidence was noted for bloodstream infections due to coagulase-negative staphylococci ($p=0.003$) and *Staphylococcus aureus* ($p=0.018$) during 2016 (3.06/1,000 central line days). Identifying patient risk factors and focusing on evidence-based reductions, such as chlorhexidine skin antisepsis, judicious use of antimicrobial therapy, catheter optimisation, peri-line care, and adherence to guidelines, could further reduce infection rates.

We previously reported that the existence of Y chromosome sequences in the mitochondrial DNA of the white-footed mouse, *Peromyscus leucopus*, was discovered by basic molecular techniques, but we could not determine the phylogenetic position of this molecule. To clarify this issue, and because of its value to evolutionary studies, we performed a more detailed phylogenetic analysis based on the complete mitochondrial sequence of this molecule. Our analyses indicate that this is a mitochondrial pseudogene, which is derived from an ancestral Y chromosome. In addition to being present in *Peromyscus*, the pseudogene is also present in *Rattus*, and thus, this sequence is evolutionarily conserved between these two genera, enabling us to more clearly place the event that gave rise to the peromyscine Y chromosome.

Q: REST Callback URL issue We have a RESTful application that has a worklight application on the back-end and was wondering if there is a way to have the application to send a callback url to one of the applications when a specific database record was updated. We have three tables. Homes Houses Households In the REST application we defined a record which would be deleted from the database and then send a message to the back-end worklight application which would trigger a JSON message sent to the device to notify the user that the record was deleted from the database. Is there any way to have a custom callback url which will trigger a specific JSON message to the device when a record in the database is changed? A: Yes, you can create an additional REST service on your back end and implement a workflow that will update the record, change an attribute, etc. and once that is done you can invoke a new REST service with a params parameter and trigger a new workflow to notify the mobile client.

Mars has always been the most difficult target for exploration; one of the main reasons is that we don't know whether the planet has enough natural resources to sustain a crew, and it could be years before humans fly to Mars. NASA's Mars Reconnaissance Orbiter (MRO), circling the Red Planet at a distance of 600 miles (965 km), was actually launched in 2005, which makes its arrival pretty historic. Previous missions sent by other countries and even other NASA missions have been sent to Mars before, but not one has gone to the Red Planet orbit
