downloadbleg.co.Q: Checking if a string contains two or more set of characters Possible Duplicate: php regular expression for multiple repeats If I have a string and I want to check to see if it contains two sets of characters. For example, I want to verify if "myString" is a valid value for the following fields: FirstName - MyString contains F1...F3 LastName - MyString contains L1...L2 A: Something along these lines should work: `preg_match('/^(?:([F]1|[L]1|[L]2)(?:\s+|$))+$/ ', $string);` in anisotropic symmetry breaking systems, can be quite large due to the compressibility of massless theories. This is to be contrasted with the small anisotropy as predicted in [Son-aniso] for large anisotropy quenches in the massive theory. [³]: In the massive theory, we expect $M_{\{s\}}(t)/(T(t)^3) \sim 1$, which we have verified in our numerical simulations to high accuracy. In the massless theory, $M_{\{s\}}(t)/(T(t)^3) \sim \eta(t)^{2/3}$ which we have verified to high accuracy for our simulations. [⁴]: If we had chosen to use $u_{\{xy\}}$ to fix the boundary condition $u_{\{xy\}}(\infty)$, then the initial condition would be $u_{\{xy\}}(\infty) = \eta^{-1} \sim T(t)^{-2}$. c6a93da74d
