The RAM which may include PRAM or cache, and RAM is the part of the computer system that temporarily stores information. All sound cards have a dedicated sound input and output port. You can get this by using the web interface at <http://www.composites.org/pigments/meso/composite-chemistry/phy/t.html> PDF file to show you how to disassemble your printer. is the premier printer technology provider for small businesses, manufacturers and commercial printers worldwide. Return to your local store from here. Depending on your system, you may have other devices that can provide this (virtual) serial port. USB keyboards and mice are the most common: to use one of these on a Leonardo, you can connect it to the USB port on your computer instead of an Arduino via a USB-to-serial adapter; since the Arduino Leonardo uses the serial ports A0 - A6 (normal port A0) as well as D2, D3, D7, and D8 (special port D2, D3, D7, and D8) as its virtual (CDC) serial port, a USB-to-serial adapter with a different combination of D2 - D8 is required. For the same reasons, an Arduino Nano with a USB-to-serial adapter also requires a different combination of D2, D3, D7 and D8. If your computer only has a serial port on the native port (for example, COM1, COM3 or COM4), then you need a special USB-to-serial adapter, called a FTDI serial converter, to pass the data in and out of it. You will probably need to buy this separately (don't ask me why they name their products differently - I have no idea), but with some care, you can build a cheap 16-bit to serial converter from an inexpensive USB-to-RS232 board. I have also seen this on eBay.)
