The preliminary observations showed that macaques on YNI were observed using a variety of tools, including rocks and bone, to process nuts (electronic supplementary material, S2). They used both single- and multi-tool sessions. Tool types were observed, including lava rock (≤ 3 cm in diameter), large multitool set, and small to medium single-tool set. The data showed that males and younger macaques cracked more nuts, compared with other macaques and females. Additionally, macaques increased the rock size as nuts cracked. The smaller nuts are transported to the seafront. We recorded 64 nut-cracking events for this study. Oil palms nuts could be split into four general categories: pinched, cracked, split, and broken [17]. We assumed that the cut and split methods were the same, as no split-nuts were found. By comparing the observational duration, we were able to estimate the average use time of each tool by macaques. We also recorded the use of tools for each activity: eating, tool modification, social grooming, other, and not recorded. The tool use time was calculated as the duration to use one tool. A total of 115 different tool types, such as lava rock, hammer stone, wedge, and anvil, were observed. We found that macaques spent more time using tools to crack nuts than to break and split them (Table 1). The results of this study showed that macaques on YNI were nut-cracking the largest percentage of the observation time, followed by other monkeys and then humans. The behaviour of humans was confirmed by DNA analysis using cheek tissue samples, which were collected on macaques from the YNI. Our results showed that macaques on YNI are increasingly using various tools to crack nuts, especially lava rock and large multitool sets. The use of larger rock surfaces to crack nuts may have been a consequence of the nut availability on the coastal area, because there are trees bearing nuts nearby the wetland area. Macaques on YNI have recently adapted to trees bearing nuts [14]. The nuts of *Elaeis guineensis* are used by macaques on YNI and chimpanzees in West Africa. Additionally, macaques could easily use palm nuts, such as *Astrocaryum campestre* and *Orbignya* sp., because they are abundant in the intertidal habitat and easily consumed. Hence, the increasing use of nuts has also occurred in response to the increasing availability of the nuts on the intertidal zone. 5ec8ef588b
