New Camera RAW development studio features, 2.0 and 3.5 include Expression Versioning, Merge Layers, and Auto Layer Adjustments. 10.1 fixed awkward behavior when opening layers to preview, improved color matching algorithms, and added support for the popular.tiff format. The updated program operates more smoothly and features less lag. The Move, Rotate and Resize tools now have autofit features, and you can now custom size textboxes and rulers. Two new tools also have been added to the pre-CS6 Essential Panel: Layer Auto Mask and Layer Panoramic Border. A suite of tools for working with PDFs has been incorporated into the contextual menus. Although Jose Angel has shared on the forums his thoughts on the new version, I thought I'd share my own opinions on the new creative tools and the changes to document files. I'm most impressed with the new template system and hope that option helps bring out those who came only for the new creative features, but missed the maintenance on their last two computers. I'm also impressed with the new object selection/select features, something that for years I've been craving to find in Photoshop. You can drag any layer anywhere, and there's always the option to reposition the layers within that group. Working with groups is one of the most efficient ways to organize your files and keep them separate. You might want to add a new layer below the group, or even jump back and forth between the group and the new layer. Drag a layer to the top of the stack and it will drop right on top of all your other layers, giving you one more, easy way to work.

Selections are the most used tools in Adobe Photoshop. It is one of the most used features in an image editor. It's basically used to remove the areas of focus. There's an option of a free-form selection with a grid and a lasso selection which work quite similarly. It also allows the selection of the object in the picture, but it uses more of your time and effort than the free-form method. Both free-form and lasso selection are highly used in Adobe Photoshop. The Selection Tool is another significant tool for Photoshop. It is mostly used to select a specific part of an image for editing. It allows you to remove or create a selection of objects from the picture. It allows you to select a specific area in the picture, but the tool offers great functionality and it's easy to use. The illustration tool is used by some people to correlate to the artistic skills I learned when in school. I was pretty good at it but most of the illustrations I have seen in schools were created with the help of a graphics software. It's a tool to create fantastic creations and you can express your creativity with it. Composing a texture is an example of using this tool. You can also use it to create a picture or collage of your imagination.
