4K movies can be created right in Photoshop Elements 2021, thanks to support for the XAVC S format and 4K profiles. Elements looks at the HD or 4K quality setting on the camera when shooting to decide which 4K setting to use. (3D support is also available in the latest version of the program.) While the quality looks great, you can't adjust the standard HD setting in Elements after you shoot. (I prefer not to use the HD setting anyway.) I like Elements because it's powerful, but not bloated. Elements has the same interface and tools that you know from using the desktop version of the program, and it is as feature-rich as that version of Photoshop. The 2019 version feels like a good foundation for the program. But the 2020 version offers some significant improvements. The new Levels panel (customizable by clicking and dragging a square icon) looks familiar, but is useful because it is more efficient. The Quick Selection tool is a timesaver because you can make the selection frame large or small. (You can't choose the size in the new version.) Any layer or selection is a central Focus Point in Elements. You can select, delete or copy it. This is the best version of Elements yet. Their new Curves adjustment offers two separate selection fields (luminance and color), giving you more precision in editing. Highlights also use new HDR correction algorithms. The Lens Correction tool combined with adjustments in the Adjustments panel is used to correct camera distortion.
